Om Lahore

Software Engineer (B.Tech Computer Science, 2026)

Mumbai, India | +91 91568 02668 | omlahorey@gmail.com | github.com/omlahore | linkedin.com/in/om-lahorey

Open to on-site or hybrid roles in Pune, Mumbai and Bengaluru, and remote.

Education

Vishwakarma Institute of Technology (VIT) — Pune, India

Bachelor of Technology (B.Tech), Computer Science, CGPA 8.8/10 — *November 2022 - June 2026*

Certifications: AWS Cloud Essentials, IBM DevOps, Cisco CCNA and Cybersecurity Essentials, Harvard CS50P.

Coursework: Data structures and algorithms, operating systems, database management systems, computer networks, object-oriented programming. 400+ problems solved on LeetCode, including about 100 medium.

Technical Skills

Languages: Java, TypeScript, JavaScript, Go, Swift, Python, SQL, C, C++
Backend: Node.js, Express, REST application programming interfaces (APIs), GraphQL, concurrency, error handling
Databases: PostgreSQL, MongoDB, Redis, schema design, query debugging
Infrastructure: Docker, Kubernetes, Amazon Web Services (AWS), GitHub Actions, Continuous Integration and Continuous Deployment (CI/CD), Linux
Practices: unit and integration testing (Jest, Go test), Identity and Access Management (IAM) policies, code review, Git, incident response

Experience

Founding Engineer — June 2026 - Present

Ensueno — *Mumbai, India*

- Build retrieval-augmented generation services on PostgreSQL with the pgvector extension, covering document ingestion, embedding storage and similarity search.
- Design the application programming interface (API) surface and the PostgreSQL schema as the founding engineer, and own each of the 3 services end to end from schema through deploy.

Web Developer — April 2024 - June 2026

Marketing Mojito — *Remote*

- Owned Amazon Web Services (AWS) infrastructure across 20 or more client properties: Simple Storage Service (S3) hosting, Domain Name System (DNS) records, Transport Layer Security (TLS) certificates, and per-client least-privilege Identity and Access Management (IAM) policies.
- Built Docker-based Continuous Integration and Continuous Deployment (CI/CD) pipelines on GitHub Actions for 20 or more properties, and set up Prometheus and Grafana alerting on central processing unit (CPU), memory and error rates.
- First responder for production incidents including site compromises: contained and recovered the affected sites, ran the root-cause forensics, and wrote the postmortems.
- Delivered 20 or more client sites in JavaScript and React, and cut median page load time by roughly 20 percent.

Web Development Member — August 2023 - August 2024

Microsoft Learn Students Association — *Pune, India*

- Built internal web tools in React and Node.js, and ran three coding workshops for 30 or more students.

Projects

RemoveMacAI | *Swift, SwiftUI, Objective-C, macOS*

- Built an open-source macOS debloater, a native SwiftUI app plus a command-line tool, that turns off Apple Intelligence, deletes its on-device models through Apple's asset service over XPC, and applies 40 reversible privacy and system tweaks, locking the managed ones in a configuration profile with System Integrity Protection left on.
- Reached #1 on Hacker News with 4,800+ GitHub stars and 57,000+ downloads, was covered by The Verge, Ars Technica, The Register, MacRumors and AppleInsider, and ships through Homebrew with attested GitHub Actions releases (github.com/omlahore/RemoveMacAI).

Open Source Contributions

61 merged pull requests across 24 open-source repositories, including four Cloud Native Computing Foundation (CNCF) projects (Kyverno, Volcano, OpenKruise and zot), Grafana and Google's Kubernetes History Inspector. All publicly verifiable.

- zot, a CNCF container registry (github.com/project-zot/zot, 9 merged): brought the registry in line with the Open Container Initiative (OCI) Distribution Specification, covering tag and repository pagination, an integer overflow on large page sizes, error codes for missing repositories and blobs, invalid tags on manifest push, and the upload Range header on streamed chunks.
- Volcano, a CNCF scheduler for batch and AI inference workloads (github.com/volcano-sh, 10 merged across kthena and volcano): fixed a data race on the router's datastore callbacks, stale grace-period state when marking a pod unavailable failed, deletion events keyed incorrectly for tombstoned objects, and CronJob conflict and status-update errors.
- Grafana (github.com/grafana/grafana, 2 merged): fixed sparklines drawing flat for values below 1e-6, where the range minimum and maximum collapsed to the same float, and bounded the decimal count passed to toFixed in number formatting.
